Background: Pax6 is the best described member of the paired box (Pax) family of genes encoding tissue-specific transcription factors. The Pax6 protein contains paired box and homeobox domains with DNA-binding activities, and a Pro/Ser/Thr-rich C-terminal domain with transactivation function. Pax6 is a transcription regulator important in the development of the eyes and other sensory organs, the nervous system, and other homologous tissues derived from the ectoderm. Pancreatic development also depends on Pax6, and Pax6 is used as a marker for pancreatic endoderm when inducing differentiation of stem cells.

Applications:

- (A) Pax6 recombinant protein (aa 1-209) (5 µg) was resolved by SDS-PAGE and stained with Coomassie dye. Pax6 has been shown to run at an apparent molecular weight higher than predicted.
- (B) Western blot detection of Pax6 recombinant protein (aa 1-209) (50 ng) using 1 µg/ml anti-Pax6 monoclonal antibody (PR-1G2).
- (C) Indirect ELISA detection of immobilized Pax6 recombinant protein (aa 1-209) with titrated amounts of Pax6 mAb (PR-2D11).
